Behind transgender identities – the biophysics & the societal deficits creating the phenomenon

Florent Pirot

Unaffiliated researcher

ABSTRACT

Transgender identities, with or without surgical changes are produced by individual decisions which resonate nevertheless with a series of information deficits and also spill from the biophysical effects of artificial sources of contamination. Findings from other researchers and the author's experience are brought together to prove the point.

The first theorizations by John Money followed the increases in birth defects after World War 2 from the early days of the nuclear industry with its many leakages, especially from mining and milling, and atmospheric test fallout ; the rise in birth defects in general includes a rise in sexual birth defects that include hermaphroditism, a starting base for the issue. Endocrine disorders are another common after effect from internal contamination with alpha emitting nanoparticles as they reach the hormone producing glands and damage their functioning ^[1] (either necrosis, or uncontrolled proliferation from bystander effect ^[2] – for instance, in ^[3] it is noted a very significant decrease in testosterone levels in uranium miners vs. unexposed controls) – see also ^[4] on traumatic brain injury, ^[5] on schizophrenia and ^[6] on thyroid hormone disruption.

Endocrine disorders are most crucial in gender identity disorders. An exceptional case was found by the author as he wandered not far from the unfamous Sauclières tunnel which was used as a firing range for depleted uranium shells in the 1990s and where a number of rounds escaped the tamper and exploded in nature, spraying depleted uranium. The area suffers from environmental damage from the depleted uranium and a local publicly-funded health survey ^[7] has shown a significant level of premature deaths, high levels of cardiovascular diseases, very high levels of mental disorders, among other things. A woman living in a farming exploitation in the area was seen by the author with a very overgrown mouth pilosity (a dozen moustache hairs that had grown exactly like cat whiskers). Another interpretation of the gender identity disorder where guns replace dysfunctional penises in men easily explains the recent rogue shooter case (Valentin Marcone) in the exact same area. Valentin Marcone had a training range that structurally replied to the closed Tunnel de Sauclières. The Tunnel de Sauclières, under a hilltop, let escape DU rounds across a valley, rounds exploded sometimes on the other side of the valley ; Valentin Marcone

elaborated a sniper training range from his flat in a small building that had its target on the other side of the valley among trees. As a woodworker in the area he was very exposed to depleted uranium (a visit by the author two years ago proved the still acute levels of depleted uranium dust in this inhabited area between Ganges, Dourbies and the tunnel in particular). Marcone associated himself mentally to the Army, even signing a military petition just before his rampage, while he obviously knew of the tunnel since he reproduced it with his sniper gun, but also posed as a victim and rebel on social networks. To lead a community rebellion he had to be strongly contaminated and this certainly created the schizophrenic process presented in ^[5] with the case of 210Po in cigarettes. As the military has since the end of 2020 undertaken the dismantling of depleted uranium weapons he obviously found out he was losing purposes for rebellion and hence the logical decompensation of the schizophrenic relation to depleted uranium dust that he was incorporating gladly for victimization purposes while hoping to fight it later for communitarian purposes (with certainly the occitanist community as political market) creating the urge to kill as only issue for his suffering body and escape from ridiculization. Because since two relations to depleted uranium conflicted in his mind (hatred, and potential source of celebrity and income) he fixated on the weapon and on the tunnel firing range in particular, had « become » it. Another similar case can be underlined with a recent case of death threats against police forces in Scotland, with a « high powered rifle » suggested to be used. The case obviously replies to the Dundrennan firing range and its local cancer cluster. Is Ms. Nicola Sturgeon herself suffering from hormone changes (as suggested by her thick neck and limited feminine traits) because of depleted uranium exposure as she goes to Kirkcudbright frequently for grassroots militantism ?¹ This is a very sure answer. She hides the firing range like the political clitoris that she hopes to plant into the

United Kingdom someday in a master move, maybe in a live TV debate...

Non-binary people in general also present traits of schizophrenia in conjunction with hormone disorders from internal contamination with alpha emitters. The many sources of contamination that have been detailed in the author's previous articles (see also for instance ^[8] ^[9]) are as many possible causations. The deliberate acceptance of the plural form for self-designation, and organization thereof, shows actual crystallization of a peaceful schizophrenic state. The brain has separated in two and is only happy when acknowledged as such. Socialism, in its positive (left-of-center) acceptance is key as well (as underlined with the issue of welfare checks in ^[5] – as well as for V. Marcone above in a national-socialist way²) – the choice of being « non-binary » is directed by the demand for social recognition, it allows to be part of a group. As for the contaminating behaviour with cigarette fumes presented in ^[5], there is a moral contaminating behaviour with the specious « non-binary » concept that is intended for trying to create mindboggling questioning in others.

The first key factor of sexual differentiation spills from a combination of issues. The deficit of public recognition that the clitoris naturally goes erect exactly as a penis and competes in size with it is the first problem – that the erect clitoris can penetrate the man's anus as he penetrates the vagina is not well known. Spotted hyenas show the truth that can also be seen for instance with allosaurus and tyrannosaurus skeletons, where the rear bone of the allosaurus shows it is a female T-Rex. This deficit of information, where the penis is the totem and the clitoris the taboo, naturally produces as reply the second-bests that are feminine and masculine homosexuality, and bisexuality. Transgender people make the deliberate choice of fitting by changing their bodies to allow their sexuality to be framed by some of these societal standards. A woman getting a penis creation surgery is certainly the final step in the progressive

forgetting of naturality in the body. Going transgender is a choice, but a choice framed by a societal context that suffers from a tremendous knowledge deficit. At one side of the spectrum, those who make this choice for purposes of achieving recognition and fame can be condemned, as opposed to those who have suffered from a congenital malformation. It is also true that many men in particular are known to have an attraction for women with a penis – prostitution in particular being a way for them to find satisfaction. This creates also another kind of incentive for some women questioning themselves under the effect of internal contamination with alpha emitting nanoparticles, with surgery allowing easy meeting of many men. Nevertheless it is clear that these men attracted by women with a penis suffer from lack of information on the reality of the clitoris erection.

« Male oppression » does apply partly, with the lack of societal recognition of the clitoris, but individual choices are at the end what matters and after pollution with alpha emitters is dealt with compensation for surgery choices should be left to decide to private insurers only. Education however has to play a significant role. The depollution on the other hand can create a degree of profitability with the recycling of alpha emitters as energy source, allowing for private businesses to care for that. Even ²²⁶Ra and ²²⁸Ra from car fumes become fissile after neutron capture (in direct application of the rule presented in ^[10] – as ²²⁶Ra and ²²⁸Ra are anti-squeezed i.e. shuriken in shape ^[11], they necessarily become fissile after neutron capture, there is no alternative), the olive-frame subcritical concept with a mix of thermal and rapid neutrons presented in ^[12] is ideal for their recycling – indeed the stability of the squeezed state (fissile) in particular is limited by the relative low weight of these emitters, only the short-lived metastable state (i.e. ^{227m}Ac for ²²⁶Ra) really can be exploited easily³ and for this to work

² For Valentin Marcone it is expected he read and inspired himself directly from Sismondi's 1836 *Etudes politiques et constitutionnelles* where he advocated for militias - Sismondi's cult of Latin peoples being also ideal for an occitanist militant.

³ With certainly a fission cross section of 4000-relative to its short half-life, this can be compared with ²³⁴Pa – then ²²⁷Th also allows fission with a cross section of 200 but there is a half-life gap of 21 years inbetween both.

thermal and fast neutrons have to coexist which is why the olive-frame subcritical is ideal.

About the journal

The journal is hosted by eSciPub LLC. Our aim is to provide a platform that encourages publication of the most recent research and reviews for authors from all countries.

About the publisher

eSciPub LLC is a publisher to support Open Access initiative located in Houston, Texas, USA. It is a member of the largest community of professional publishers in the United States: the Independent Book Publishers Association. It hosts more than 100 Open Access journals in Medicine, Business & Economics, Agriculture, Biological Sciences, Chemistry, Education, Physical Sciences, Sociology, and Engineering and Technology.
